Statement by

Kevin Warsh

Chairman

Board of Governors of the Federal Reserve System

before the

Committee on Banking, Housing, and Urban Affairs

U.S. Senate

July 15, 2026

Chairman Scott, Ranking Member Warren, and other members of the Committee—good morning.

It's a privilege to join you. At my first appearance before this panel as Chairman, I am particularly honored to represent my superb colleagues throughout the Federal Reserve System.

In submitting the Board's *Monetary Policy Report*, I think of a long line of central bank chiefs who came before Congress in keeping with the Federal Reserve Act. I think also of earlier efforts, going back to the time of the Framers, to create a central bank that would endure and serve the nation's founding principles.

One of the large figures in the Federal Reserve's history is Alan Greenspan, who passed away last month after a century of life. By my count, my friend appeared before Congress more than two hundred times, displaying his agile mind and his distinctive way with words. We at the Fed recall the Chairman's strong and steady hand in a period of rapid economic change. And we honor his memory.

As a country, we just marked our 250th year. And when Americans count our blessings, we can include an economy predicated on the brilliance of our constitutional design and system of ordered liberty—an economy without equal in all it's done for human flourishing.

Some forms of Fed communications are discretionary, but not this one—and for good reason. It is a prudent and wisely conceived obligation, designed to keep the Fed accountable, responsible, and faithful to its congressional mandate of full employment and price stability. These obligations are of a piece with the Fed's rightful independence in the conduct of monetary policy.

Today we are at a hinge point in history. It's up to all of us to meet this moment. The task of this generation of policymakers—and of individuals throughout the private sector—is to ensure the American economy excels far into the future.

* * * *

The Fed's number one objective is to get monetary policy right—or as near to it as we possibly can. That is our clear and constant aim, the star we steer by. And if we get policy right—and we will—the inflation surge of the last five years will be a thing of the past.

A month ago, I chaired my first meeting of the Federal Open Market Committee. My colleagues and I recognize that high inflation has been an undue burden on American households and businesses. While monthly price fluctuations are inevitable—especially in an unsettled world—underlying inflation over longer time horizons is determined largely by monetary policy.

The members of our Committee have no tolerance for persistently elevated inflation. And we share a resolute commitment to restoring price stability. This was the focus of our June meeting, at which we decided to hold the target range for the federal funds rate at 3½ to 3¾ percent.

Naturally, our work at the Fed demands a proper reading on economic conditions. As you see in our *Monetary Policy Report*, economic activity is expanding at a solid pace, showing resilience in the face of recent developments. Household consumption growth is moderate. Manufacturing output has moved up steadily this year. The housing sector, however, gives a different picture and continues to lag.

The most striking feature of the economy right now is business investment. The rapid pace—which appears to be accelerating—reflects, in large part, the construction of data centers and the immense demand for the AI-related equipment and software that fill them. Investment in

equipment overall increased about 8 percent for the year ending in the first quarter. Within that category, high-tech spending logged an especially impressive growth rate of nearly 25 percent on a four-quarter basis. We don't know the extent to which the economy will benefit from the AI buildout. Yet it seems inevitable that what is now called "AI investment" will soon be called just "investment." Even so, new opportunities for the economy introduce new challenges for policymakers. We at the Fed are monitoring the implications for inflation and the labor market.

That brings me to the supply side, where productivity growth has been strong, predating gains from AI adoption. America's labor market appears broadly stable. Job creation has kept pace with the workforce. The unemployment rate is low and has changed little over the past year. We're seeing relatively few layoffs, only slight variance in the rate of job vacancies, and solid growth in nominal wages.

* * * *

I came to my new position as a believer in the best traditions of the Federal Reserve. The performance of our nation's central bank depends on a commitment to excellence, professionalism, and integrity. Humility about what we know—and the courage to revisit our prior views—are also hallmarks of a great institution like ours. All of these standards define the culture of the Fed, and it's my responsibility to uphold them.

I am heartened by the welcome I've received and by the encouragement of my colleagues in considering how best to advance the conduct of policy. We have a duty to point the institution forward—to take a fresh look at current practices to make sure we are serving our objectives.

And we are going about it systematically. I have appointed a task force in each of five areas that are central to the broad conduct of monetary policy. We have engaged some of the

very best minds, from inside and outside the economics profession. They are supported by specialists from the Fed's expert staff. The task forces have been given a straightforward charge: Start with first principles, ask hard questions, examine current practices, consider alternatives, and, ultimately, propose next steps for policymaker consideration. The purpose here is to equip the Fed to make better decisions in monetary policy and to put these years of high inflation behind us.

The first task force will assess the form and function of Fed communications. It will ask: What is the efficacy, and what are the risks, of how we currently deliberate and convey our policy choices?

The second task force will review the Fed's balance sheet policies, including the ample-reserves regime and the composition of asset holdings. It will ask: What are the advantages and disadvantages of that regime, and what are the alternatives?

The third task force will evaluate new data sources and consider methodological changes to improve the information upon which we rely. It will ask: How do we ensure that policymakers are receiving accurate, relevant, contemporaneous, actionable data on the state of our economy?

Our task force on productivity and jobs will survey the pace, reach, and impact of new general-purpose technologies. We've experienced technological advances all our lives. But given the scale of investment—and potential changes in the method and speed of innovation—we might be seeing changes of a different order. The task force will survey the landscape and ask: What do these changes mean for America's productive capacity and for American workers? And what are the implications for the Fed in pursuit of our employment and inflation mandates?

Finally, the task force on inflation frameworks will examine the drivers of inflation and weigh a range of ideas for delivering price stability. This group will ask: Do our models and our thinking provide an empirically robust view of prices and outputs in our dynamic economy? Can we do better?

We are starting a new chapter at the Federal Reserve at a consequential time for our nation. It's been a privilege to return to the Fed and to work again with so many talented and dedicated people I'm fortunate to call my colleagues.

I can report to you that we intend to be fit for purpose and focused on the future. We are the Federal Reserve, and we are as determined as ever to fulfill the mission that Congress has given us.

Thank you, and I welcome your questions.
